

**Amendments to the Specification:**

Please amend the specification as follows:

Please replace paragraph starting at page 5, line 27, with the following rewritten paragraph:

The pitch of stranded cores is desirably not more than forty times the layered core diameter (a diameter of a circle formed by connecting centers of the four cores). By taking the pitch to be not more than forty times the layered core diameter, use in a mobile phone can reduce effects on a transmitting/receiving circuit. During stranding, polyester yarn 35 may be located at the center. Further, a polyester tape, or a copper-metalized or -plated polyester tape may also be wrapped for holding shape after the stranding.
